

a Correct runs by domain

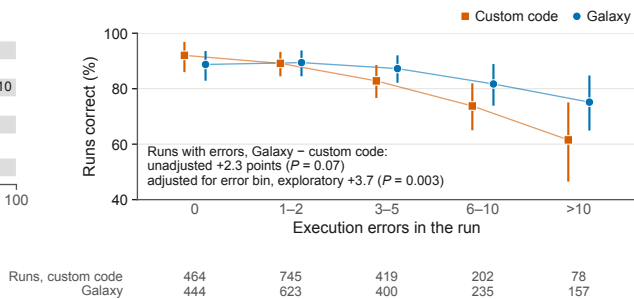

b How each Galaxy run used Galaxy, and how it ended

c How often execution steps failed

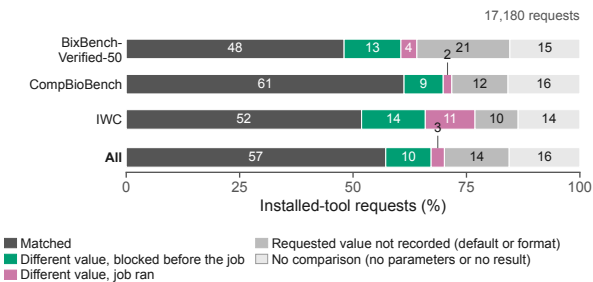

d Final correctness among runs with execution errors

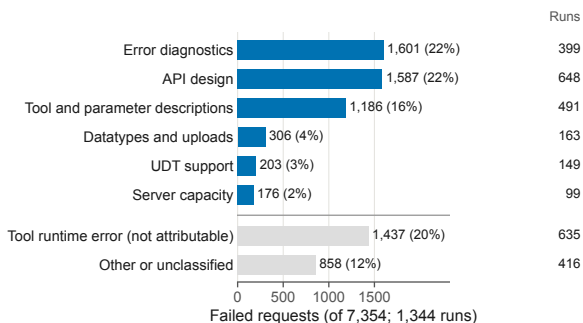

e Parameter checks on installed-tool requests

The interface compares the requested parameters with those Galaxy validated or recorded

f Failed requests and candidate infrastructure improvements

Failure classes grouped by the change most likely to help (unvalidated codebook in Source Data)

After a request was blocked for a different value, the run later completed a job of the same tool in 71% of 1,718 cases (with matching parameters in 53%). Matching parameters do not show that the settings were scientifically appropriate.
